ABOUT ME

Currently pursuing a B.E in Computer Engineering at St. Francis Institute of Technology, I am interested to work as a Research Intern and contribute my best in the period. Additionally, I have done a lot of projects as a part of my curriculum .

EDUCATION

2023 - 2027

B.E in Computer Engineering

St. Francis Institute of Technology

PROJECTS

1. Face Recognition System

Developed a real-time criminal face recognition web application using Python and Django that identifies individuals by matching webcam images with a mugshot database. The system uses RetinaFace for face detection and ArcFace through DeepFace for accurate facial feature matching under varying conditions. It retrieves and displays relevant criminal details from a structured database through a web interface built with HTML, CSS, and JavaScript.

2. Traffic Congestion Prediction System :

Smart City Rush Hour Prediction: Developed a machine learning-based system to predict urban traffic congestion during rush hours using a Gradient Boosting Regressor trained on 8,000+ traffic records. The system integrates real-time weather data to model weather-traffic correlations and improve prediction accuracy. A full-stack web application was built using React, Node.js, and Python with interactive map visualization for route-level congestion analysis and prediction.

3. Resume Screening System (On Going) :

Built a full-stack AI-based resume screening system that matches resumes with job descriptions using NLP techniques. The system combines semantic similarity using GloVe embeddings with rule-based skill matching to compute candidate scores and identify skill gaps. Implemented a role-based ATS-style platform with a Flask backend and React frontend supporting both bulk resume screening and individual self-evaluation.

COMPETITIONS :

1. e-Yantra Robotics Competition 2024 – Logistic Co-bot Theme:

Participated in the robotics competition organized by e-Yantra at Indian Institute of Technology Bombay, focusing on warehouse automation using collaborative robots. Set up the robotics simulation environment using Robot Operating System 2 and Gazebo, and implemented autonomous robot motion including translation control as part of Task 1B. Also developed a preliminary hard-coded solution for Task 1C involving robot navigation and control logic.

2.Logithon – Logistics Innovation Hackathon :

Participated in Logithon, a national logistics hackathon conducted in association with Indian Institute of Technology Bombay, where teams designed technology-driven solutions for supply chain and logistics optimization challenges.
